- The program evaluates the budget transactions entered in the 'transactions.txt' file in line with the budget information saved in the 'budget.txt' file by the user.

- The program prints the result of the evaluation on the screen at the end of the program.

- The program reads data in 'budget.txt' and 'transactions.txt' files.

- In order for the data to be read, the files must be in the same directory as the source code folder.

- The 'budget.txt' file should contain three different data types as category number, category budget and category name.

- A 'space' must be left between each data type. This way, the program will understand what data it is reading.

- Do not use the 'space' key while entering data. For example, use 'car expense' instead of 'car expenses' for the category name.

- You can enter the data you want such as 'budget.txt' and 'transactions.txt' files given as examples and delete whatever you want.

- Use the 'budget.txt' file to add new category information.

- 'Transaction.txt to add new transaction information. Use the file.

- Please delete the category information about which there is no action in the 'transactions.txt' file from the 'budget.txt' file. Otherwise, the program will not work properly.

- You can follow the values entered into the program and the results of the operations on the console screen.
